DRV8313

SLVSBA5D - OCTOBER 2012 - REVISED APRIL 2016

DRV8313 2.5-A Triple 1/2-H Bridge Driver

1 Features

- Triple 1/2-H Bridge Driver IC
 - 3-Phase brushless DC Motors
 - Solenoid and Brushed DC Motors
- High Current-Drive Capability: 2.5-A Peak
- Low MOSFET ON-Resistance
- Independent 1/2-H-Bridge Control
- Uncommitted Comparator Can Be Used for Current Limit or Other Functions
- Built-In 3.3-V 10-mA LDO Regulator
- 8-V to 60-V Operating Supply-Voltage Range
- Sleep Mode for Standby Operation
- Small Package and Footprint
 - 28-Pin HTSSOP (PowerPAD[™] Package)
 - 36-Pin VQFN

2 Applications

- Camera Gimbals
- HVAC Motors
- Office Automation Machines
- Factory Automation and Robotics

3 Description

The DRV8313 provides three individually controllable half-H-bridge drivers. The device is intended to drive a three-phase brushless-DC motor, although it can also be used to drive solenoids or other loads. Each output driver channel consists of N-channel power MOSFETs configured in a 1/2-H-bridge configuration. Each 1/2-H-bridge driver has a dedicated ground terminal, which allows independent external current sensing.

An uncommitted comparator is integrated into the DRV8313, which allows for the construction of current-limit circuitry or other functions.

Internal protection functions are provided for undervoltage, charge pump faults, overcurrent, short circuits, and overtemperature. Fault conditions are indicated by the nFAULT pin.

Device Information⁽¹⁾

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

С	hanges from Revision C (November 2015) to Revision D Page
•	Changed pin 18 of the VQFN (RHH) package from GND to RSVD 4
С	hanges from Revision B (January 2015) to Revision C Page
•	Added a new package to the Device Information table1
•	Added a new VQFN package for the device
•	Corrected a numbering error on one of the ground pins in the Pin Functions table
С	hanges from Revision A (November 2012) to Revision B Page
•	Added ESD Ratings table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section

5 Pin Configuration and Functions

Pin Functions

	PIN			
NAME	N) .	TYPE ⁽¹⁾	DESCRIPTION
NAME	PWP	RHH		
COMPN	13	22	I	Comparator negative input. Uncommitted comparator input
COMPP	12	21	I	Comparator positive input. Uncommitted comparator input
CPL	1	5	PWR	Charge pump. Connect a VM-rated, 0.01- μF ceramic capacitor between CPH and CPL.
СРН	2	6	PWR	Charge pump. Connect a VM-rated, 0.01- μF ceramic capacitor between CPH and CPL.
EN1	26	1	I	Channel enable. Logic high enables the 1/2-H bridge channel; internal pulldown
EN2	24	35	I	Channel enable. Logic high enables the 1/2-H bridge channel; internal pulldown
EN3	22	33	Ι	Channel enable. Logic high enables the 1/2-H bridge channel; internal pulldown
GND	14, 20, 28	3, 17, 20, 23, 24, 30, 31, 32,	PWR	Device ground. Connect to system ground
IN1	27	2	I	Channel input. Logic high pulls 1/2-H bridge high, logic low pulls 1/2-H bridge low; no effect when ENx is low; internal pulldown input.
IN2	25	36	I	Channel input. Logic high pulls 1/2-H bridge high, logic low pulls 1/2-H bridge low; no effect when ENx is low; internal pulldown input.
IN3	23	34	I	Channel input. Logic high pulls 1/2-H bridge high, logic low pulls 1/2-H bridge low; no effect when ENx is low; internal pulldown input.
NC	21	4, 8, 14	NC	No internal connection. Recommended net given in block diagram (if any)
nCOMPO	19	29	OD	Comparator output. Uncommitted comparator output; open drain requires an external pullup.
nFAULT	18	28	OD	Fault indication pin. Pulled logic-low with fault condition; open-drain output requires an external pullup.
nRESET	16	26	Ι	Reset input. Active-low reset input initializes internal logic, clears faults, and disables the outputs, internal pulldown

(1) I = input, O = output, OD = open-drain output, PWR = power, NC = no connect

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) $^{\left(1\right)\left(2\right)}$

	MIN	MAX	UNIT
Power-supply voltage (VM)	-0.3	65	V
Power supply voltage ramp rate (VM)	0	2	V/µs
Charge pump voltage (VCP, CPH)	-0.3	VM + 12	V
Charge pump negative switching pin (CPL)	-0.3	VM	V
Internal regulator current output (V3P3)	0	10	mA
Internal regulator voltage (V3P3)	-0.3	3.8	V
Control pin voltage (nRESET, nSLEEP, nFAULT, nCOMPO, ENx, INx)	-0.5	7	V
Comparator input-voltage (COMPP, COMPN)	-0.5	7	V
Open drain output current (nFAULT, nCOMPO)	0	10	mA
Continuous phase node pin voltage (OUTx)	-0.7	VM + 0.7	V
Continuous 1/2-H-bridge source voltage (PGNDx)	-600	600	mV
Peak output current (OUTx)	Internall	y limited	А
Operating junction temperature T _J	-40	150	°C
Storage temperature T _{stg}	-60	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to the network ground terminal.

6.2 ESD Ratings

			VALUE	UNIT
V	Electrostatio discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±3000	V
V _(ESD)	Electrostatic discharge	Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	v

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
VM	Motor power-supply voltage ⁽¹⁾	8	60	V
V _{IN}	Digital pin voltage	0	5.5	V
f _{PWM}	Applied PWM signal on ENx, INx	0	250	kHz
V _{GNDX}	PGNDx pin voltage	-500	500	mV
I _{V3P3}	V3P3 load current	0	10 ⁽²⁾	mA
T _A	Operating ambient temperature	-40	125	°C

Both VM pins must be connected to the same supply voltage.
 Power dissipation and thermal limits must be observed.

6.4 Thermal Information

6.7 Typical Characteristics

Typical Characteristics (continued)

7 Detailed Description

7.1 Overview

The DRV8313 integrates three independent 2.5-A half-H bridges, protection circuits, sleep mode, fault reporting, and a comparator. The single power supply supports a wide 8-V to 60-V range, making it well-suited for motor drive applications.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Output Stage

The DRV8313 contains three half-H-bridge drivers. The source terminals of the low-side FETs of all three half-Hbridges terminate at separate pins (PGND1, PGND2, and PGND3) to allow the use of a low-side current-sense resistor on each output, if desired. The user can also connect all three together to a single low-side sense resistor, or can connect them directly to ground if current sensing is unneeded.

If using a low-side sense resistor, ensure that the voltage on the PGND1, PGND2, or PGND3 pin does not exceed ±500 mV.

The device has two VM motor power-supply pins. Connect both VM pins together to the motor-supply voltage.

7.3.2 Bridge Control

The INx input pins directly control the state (high or low) of the OUTx outputs; the ENx input pins enable or disable the OUTx driver. Table 1 shows the logic:

INx	ENx	OUTx
Х	0	Z
0	1	L
1	1	Н

Table 1. Logic States

7.3.3 Charge Pump

Because the output stages use N-channel FETs, the device requires a gate-drive voltage higher than the VM power supply to enhance the high-side FETs fully. The DRV8313 integrates a charge-pump circuit that generates a voltage above the VM supply for this purpose.

The charge pump requires two external capacitors for operation. See the block diagram and pin descriptions for details on these capacitors (value, connection, and so forth).

The charge pump shuts down when nSLEEP is low.

Figure 11. DRV8313 Charge Pump

7.3.4 Comparator

The DRV8313 includes an uncommitted comparator, which can find use as a current-limit comparator or for other purposes.

Figure 12 shows connections to use the comparator to sense current for implementing a current limit. Current from all three low-side FETs is sensed using a single low-side sense resistor. The voltage across the sense resistor is compared with a reference, and when the sensed voltage exceeds the reference, a current-limit condition is signaled to the controller. The V3P3 internal voltage regulator can be used to set the reference voltage of the comparator.

Figure 12. Comparator As Current Monitor

7.3.5 Protection Circuits

The DRV8313 has full protection against undervoltage, overcurrent, and overtemperature events.

7.3.5.1 Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the undervoltage threshold voltage (V_{UVLO}), all FETs in the Hbridge will be disabled, the charge pump will be disabled, the internal logic is reset, and the nFAULT pin will be driven low. Operation will resume when VM rises above the UVLO threshold. The nFAULT pin will be released after operation has resumed.

7.3.5.2 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge will be disabled and the nFAULT pin will be driven low. Once the die temperature has fallen to a safe level operation will automatically resume. The nFAULT pin will be released after operation has resumed.

7.3.5.3 Overcurrent Protection (OCP)

An analog current limit circuit on each FET limits the current through the FET by removing the gate drive. If this analog current limit persists for longer than t_{OCP} , the device disables the channel experiencing the overcurrent and drives the nFAULT pin low. The driver remains off until either assertion of nRESET or the cycling of VM power.

Overcurrent conditions on both high- and low-side devices, that is, a short to ground, supply, or across the motor winding, all result in an overcurrent shutdown.

FAULT	CONDITION	ERROR REPORT	H-BRIDGE	CHARGE PUMP	V3P3	RECOVERY
VM undervoltage (UVLO)	VM < V _{UVLO} (max 8 V)	nFAULT	Disabled	Disabled	Operating	VM > V _{UVLO} (max 8 V)
Thermal Shutdown (TSD)	T _J > T _{TSD} (min 150°C)	nFAULT	Disabled	Operating	Operating	T _J < T _{TSD} - T _{HYS} (T _{HYS} typ 35°C)
Overcurrent (OCP)	I _{OUT} > I _{OCP} (min 3 A)	nFAULT	Disabled	Operating	Operating	nRESET

Table 2. Fault Condition Summary

7.4 Device Functional Modes

The DRV8313 is active unless the nSLEEP pin is brought logic low. In sleep mode the charge pump is disabled, the output FETs are disabled Hi-Z, and the V3P3 regulator is disabled. The DRV313 is brought out of sleep mode automatically if nSLEEP is brought logic high.

7.4.1 nRESET and nSLEEP Operation

The nRESET pin, when driven low, resets any faults. It also disables the output drivers while it is active. The device ignores all inputs while nRESET is active. Note that there is an internal power-up-reset circuit, so that driving nRESET at power up is not required.

Driving nSLEEP low puts the device into a low-power sleep state. Entering this state disables the output drivers, stops the gate-drive charge pump, resets all internal logic (including faults), and stops all internal clocks. In this state, the device ignores all inputs until nSLEEP returns inactive-high. When returning from sleep mode, some time (approximately 1 ms) must pass before the motor driver becomes fully operational. The V3P3 regulator remains operational in sleep mode.

FAULT	CONDITION	H-BRIDGE	CHARGE PUMP	V3P3
Operating	8 V < VM < 60 V nSLEEP pin = 1	Operating	Operating	Operating
Sleep mode	8 V < VM < 60 V nSLEEP pin = 0	Disabled	Disabled	Disabled
	VM undervoltage (UVLO)	Disabled	Disabled	Operating
Fault encountered	Overcurrent (OCP)	Disabled	Operating	Operating
	Thermal shutdown (TSD)	Disabled	Operating	Operating

Table 3. Functional Modes Summary

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DRV8313 can be used to drive Brushless-DC motors, Brushed-DC motors, and solenoid loads. The following design procedure can be used to configure the DRV8313.

8.2 Typical Applications

8.2.1 Three-Phase Brushless-DC Motor Control

In this application, the DRV8313 is used to drive a Brushless-DC motor

Motor rated RPM	M _{RPM}	4000 RPM				
PWM frequency	f _{PWM}	25 kHz				

Table	4.	Design	Parameters
-------	----	--------	------------

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Motor Voltage

Brushless-DC motors are typically rated for a certain voltage (for example 12 V and 24 V). Operating a motor at a higher voltage corresponds to a lower drive current to obtain the same motor power. A higher operating voltage also corresponds to a higher obtainable rpm. DRV8313 allows for the use of higher operating voltage because of a maximum VM rating of 60 V.

Operating at lower voltages generally allows for more accurate control of phase currents. The DRV8313 functions down to a supply of 8 V.

8.2.1.2.2 Motor Commutation

The DRV8313 can drive both trapezoidal (120°) and sinusiodal (180°) commutation due to independent control of each of the three 1/2-H bridges.

Both synchronous and asynchronous rectification are supported. Synchronous rectification is achieved by applying a pulse-width-modulated (PWM) input signal to the INx pins while driving. The user can also implement asynchronous rectification by applying the PWM signal to the ENx inputs.

Chata	OUT1 (Phase U)			OUT2 (Phase V)			OUT3 (Phase W)

8.2.1.3 Application Curve

8.2.2 Three-Phase Brushless-DC Motor Control With Current Monitor

In this application, the DRV8313 is used to drive a brushless-DC motor and the uncommitted comparator is used to monitor the motor current

Figure 15. Uncommitted Comparator Used As a Current Monitor

8.2.2.1 Design Requirements

Table 6 gives design input parameters for system design.

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Trip current	I _{TRIP}	2.5 A

8.2.2.2 Detailed Design Procedure

8.2.2.2.1 Trip Current

The uncommitted comparator is configured such that the negative input COMPN is connected to the PGNDx pins. A sense resistor is placed from the PGNDx/COMPN pins to GND.

The voltage on the COMPP pin will set the current monitor trip threshold. In this case, the the nCOMPO pin will change state when COMPP and COMPN have the same potential.

(1)

$$I_{\text{TRIP}}(A) = \frac{\text{COMPN}(V)}{R_{\text{SENSE}}(\Omega)}$$

Example: If the desired trip current is 2.5 A

Set $R_{SENSE} = 200 \text{ m}\Omega$ COMPN would have to be 0.5 V. Create a resistor divider from V3P3 (3.3 V) to set COMPN ≈ 0.5 V.

Set R2 = 10 k Ω , set R1 = 56 k Ω

8.2.2.2.2 Sense Resistor

For optimal performance, the sense resistor must have the following characteristics:

- Surface-mount
- Low inductance
- Rated for high enough power
- Placed closely to the motor driver

The power dissipated by the sense resistor equals $I_{rms}^2 \times R$. For example, if the rms motor current is 1 A and a 200-m Ω sense resistor is used, the resistor will dissipate 1 A² × 0.2 Ω = 0.2 W. The power quickly increases with higher current levels.

Resistors typically have a rated power within some ambient temperature range, along with a derated power curve for high ambient temperatures. When a PCB is shared with other components generating heat, margin should be added. Measuring the actual sense-resistor temperature in a final system, along with the power MOSFETs, is always best because these are often the hottest components.

Because power resistors are larger and more expensive than standard resistors, using multiple standard resistors in parallel, between the sense node and ground is a common practice. This configuration distributes the current and heat dissipation.

8.2.3 Brushed-DC and Solenoid Load

Figure 16. Brushed-DC and Solenoid Schematic

8.2.3.1 Design Requirements

Table 7 gives design input parameters for system design.

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE				
Brushed motor rms current	I _{RMS, BDC}	1.0 A				
Brushed motor peak current	I _{PEAK, BDC}	2.0 A				
Solenoid rms current	I _{RMS, SOL}	0.5 A				
Solenoid peak current	I _{PEAK, SOL}	1.0 A

9 Power Supply Recommendations

9.1 Bulk Capacitance

Having an appropriate local bulk capacitance is an important factor in motor drive system design. It is generally beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- · The highest current required by the motor system
- The capacitance and current capability of the power supply
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed dc, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and the motor drive system limits the rate current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

Figure 18. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

10 Layout

10.1 Layout Guidelines

The bulk capacitor should be placed to minimize the distance of the high-current path through the motor driver device. The connecting metal trace widths should be as wide as possible, and numerous vias should be used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Small-value capacitors should be ceramic, and placed closely to device pins.

The high-current device outputs should use wide metal traces.

The device thermal pad should be soldered to the PCB top-layer ground plane. Multiple vias should be used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias helps dissipate the $l^2 \times r_{DS(on)}$ heat that is generated in the device.

In Figure 19 and Figure 20, the uncommitted comparator is not used. Because this is the case, the COMPP, COMPN, and COMPO pins are tied to GND.

10.2 Layout Example

Figure 19. Recommended Layout Example For HTSSOP PWP Package

Layout Example (continued)

Figure 20. Recommended Layout Example For QFN RHH Package

10.3 Thermal Considerations

The DRV8313 has thermal shutdown (TSD) as previously described. A die temperature in excess of 150°C (minimally) disables the device until the temperature drops to a safe level.

Any tendency of the device to enter thermal shutdown is an indication of excessive power dissipation, insufficient heatsinking, or too high an ambient temperature.

10.3.1 Heatsinking

The PowerPAD package uses an exposed pad to remove heat from the device. For proper operation, this pad must be thermally connected to copper on the PCB to dissipate heat. On a multi-layer PCB with a ground plane, add a number of vias to connect the thermal pad to the ground plane to accomplish this. On PCBs without internal planes, add copper area on either side of the PCB to dissipate heat. If the copper area is on the opposite side of the PCB from the device, use thermal vias to transfer the heat between the top and bottom layers.

For details about how to design the PCB, see *PowerPAD Thermally Enhanced Package* (SLMA002) and *PowerPAD Made Easy* (SLMA004), which are available at www.ti.com.

In general, providing more copper area allows the dissipation of more power.

10.4 Power Dissipation

The power dissipated in the output FET resistance, or r_{DS(on)} dominates power dissipation in the DRV8313. A rough estimate of average power dissipation of each half-H-bridge when running a static load is:

$$\mathsf{P} = \mathsf{r}_{\mathsf{DS}(\mathsf{on})} \times (\mathsf{I}_{\mathsf{OUT}})^2$$

where

- P is the power dissipation of one H-bridge,
- r_{DS(on)} is the resistance of each FET, and
- I_{OUT} is equal to the average current drawn by the load.

(2)

At start-up and fault conditions, this current is much higher than normal running current; remember to take these peak currents and their duration into consideration.

The total device dissipation is the power dissipated in each of the three half-H-bridges added together.

The maximum amount of power that the device can dissipate depends on ambient temperature and heatsinking.

Note that $r_{DS(on)}$ increases with temperature, so as the device heats, the power dissipation increases. Take this into consideration when sizing the heatsink.

11.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E[™] Online Community *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support TI's Design Support Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.3 Trademarks

PowerPAD, E2E are trademarks of Texas Instruments. All other trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.5 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the mostcurrent data available for the designated device. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGING INFORMATION

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

⁽³⁾ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

⁽⁴⁾ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
