### **INTRODUCTION**

The AW5025 is a Low Noise Amplifier designed for Global Navigation Satellite Systems (GNSS) as GPS, GLONASS, Galileo and Compass. With on-chip DC blocking capacitors at RFIN and RFOUT, The AW5025 can be close to the antenna, requires only one external input matching inductor, and reduces assembly complexity and the PCB area, enabling a cost-effective solution.

The AW5025 with patented Smart Linearity Technology (SLT) achieves ultra low noise figure, high linearity, high gain, over a wide range of supply voltages from 1.5V up to 3.6V. All these features make AW5025 an excellent choice for GNSS LNA as it improves sensitivity with low noise figure and high gain, provide better immunity against out-of-band jammer signals with high linearity, reduces filtering requirement of preceding stage and hence reduces the overall cost of the GNSS receiver.

The AW5025 is available in a small lead-free, RoHS-Compliant, 1.1mm x 0.7mm x 0.42mm 6-pin LGA package.

## APPLICATION INFORMATIONS

### EN control

The AW5025 includes an internal switch to turn off the entire chip: apply logic high to EN to turn on, and a logic low to shut down.

### List of components

1. The AW5025 requires only one external inductor for input matching. If the device/phone manufacturers implement very good power supply filtering on their boards, the bypass capacitor mentioned in this application circuit may be optional. With the capacitor we can get better performance like a little higher gain etc. The value is optimized for the best gain, noise figure, return loss performance. Typical value of inductor is 9.1nH, capacitor is 1nF.

For schematics see [Figure2](#).

2. The output of AW5025 is internally matched to 50 ohm and a DC blocking capacitor is integrated on-chip, thus no external component is required at the output.

3. The AW5025 should be placed close to the GPS antenna with the input-matching inductor. Use 50-ohm microstrip lines to connect RF INPUT and RF OUTPUT. Bypass capacitor should be located close to the device. For long Vcc lines, it may be necessary to add more decoupling capacitors. Proper grounding of the GND pins is very important.

Table6 lists the recommended inductor types and values; Table 7 lists the recommended capacitor types and values.
